This statistical report provides population estimates for Northern Ireland, its Local Government Districts and Parliamentary Constituencies, by age and sex.
There is no impact of Covid-19 in these mid-year population estimates, as any impact will be after mid-2019 (the time these estimates relate to)

Northern Ireland population grows to 1.894 million in mid-2019

Northern Ireland’s population (30 June 2019) was 1,893,700.

The population increased by 12,000 people or 0.6 per cent between mid-2018 and mid-2019.

The graph shows the trend from 1994-2019.

Population growth has remained steady over the past 5 years

Annual population change has remained positive over the last twenty five years.

From mid-2018 to mid-2019 growth was 0.6 per cent. Over the last five years annual growth has averaged around 0.6 per cent.

Natural change is the main driver of population growth

Natural change (births minus deaths) was the main contributor to population increase.

Natural change accounted for 60 per cent of growth last year (+7,300 people) with migration contributing the remaining 40 per cent (+4,800 people).
The Northern Ireland population continues to age

The population pyramid (left) shows the population structure.

The ageing of the population from 2009 to 2019 is evident in the increasing population amongst the older ages.

In the year to mid-2019, the number of people aged 65 or more increased by 2.1 per cent to 314,700 people.

### By mid-2019, one in six people in Northern Ireland were aged 65 and over

The proportion of the population aged 65 or more has increased from 13.0 per cent in mid-1994 to 16.6 per cent in mid-2019.

In contrast, the proportion of the population aged 0 to 15 years has decreased from 25.4 per cent in mid-1994 to 20.9 per cent in mid-2019.

### All Local Government Districts experienced population growth over the year

Lisburn and Castlereagh LGD had the largest population growth over the year (1.1 per cent) with net migration being the main contributor to population change (0.7 per cent).

Mid and East Antrim, Derry City and Strabane and Causeway Coast and Glens LGDs had the smallest population growth over the year (0.4 per cent).
Note: Throughout the report figures have been presented in a rounded form to ease readability. For example population figures have been presented to the nearest 100 and percentages have been presented to 1 decimal place. However, all calculations have been undertaken on the basis of unrounded numbers which will, in some instances, give rise to apparent discrepancies.
1 Introduction

This bulletin details the key findings from the 2019 Mid-year Population Estimates for Northern Ireland and for areas within Northern Ireland published on 11 June 2020. The majority of this bulletin contains analyses of the population and migration estimates for Northern Ireland and its 11 Local Government Districts. It also includes a brief analysis of population estimates for the 18 Parliamentary Constituencies.

Detailed tables for Northern Ireland and the 11 Local Government Districts are available on the NISRA website, as well as those for Parliamentary Constituencies, Health & Social Care Trusts and Super Output Areas. In addition, tables are available for some former geographic areas in Northern Ireland, namely: the former 26 Local Government Districts; former Education & Library Boards; former Health & Social Services Boards; former NUTS-III areas¹; and the former 582 Electoral Wards.

Population statistics are used to allocate public funds to the Northern Ireland Executive through the Barnett formula². Population estimates are also widely used by Northern Ireland government departments for the planning of services, such as health and education. These statistics are also of interest to those involved in research and academia. They are widely used to express other statistics as a rate, and thus enable comparisons across the United Kingdom and other countries. Furthermore, population estimates form the basis for future population statistics such as population projections³.

2 Background

The population estimates refer to the number of people in the population at 30 June each year. The statistics are, therefore, often referred to as the mid-year estimates. Population estimates for Northern Ireland, sub-national levels and small geographical areas are published annually and approximately one year in arrears. Population estimates are based on the most recent Census of population: each year, the population is ‘aged-on’ by one year with the number of births in the year added and the number of deaths in the year subtracted.

¹ NUTS Level III areas were changed to be equivalent to the current 11 Local Government Districts in Northern Ireland in January 2018.
² A mechanism used by Her Majesty’s Treasury to adjust the amounts of public expenditure allocated to the Devolved Administrations. See http://archive.niassembly.gov.uk/finance/2007mandate/research/090320.pdf
³ For the latest Northern Ireland population projections see https://www.nisra.gov.uk/publications/2018-based-population-projections-northern-ireland
An adjustment is also made for migration. Subsequent mid-year population estimates then use the previous year’s figures as the base.

3 Population Estimates for Northern Ireland

3.1 Northern Ireland’s population continues to increase

Figure 1: Estimated Population of Northern Ireland, mid-1994 to mid-2019*

At 30 June 2019, Northern Ireland’s population was estimated to be 1.89 million people. Between mid-2018 and mid-2019, the population of Northern Ireland increased by 12,000 people (0.6 per cent). Just over half of the population (50.7 per cent) were female, with 961,000 females compared to 932,700 males (49.3 per cent).
Over the last 25 years, the annual rate of population growth in Northern Ireland has fluctuated between a low of 0.1 per cent in 1999 and a high of 1.1 per cent in 2007. Over the decade mid-2009 to mid-2019, the population of Northern Ireland increased by a total of 100,300 people with an average year-on-year increase of 0.5 per cent.

### 3.2 Why is the population increasing?

The two main components of population change are **natural change** and **net migration**. Natural change is the difference between the number of births and deaths, while net migration is the difference between the number of people entering and leaving Northern Ireland. **Other Changes** is a third minor component and takes into account changes in the number of armed forces stationed here.

The latest increase in the Northern Ireland population was a result of (see Figure 3):

1. Positive natural change of 7,300 people (22,600 births minus 15,300 deaths);
2. An estimated growth of 4,800 people due to net migration (25,600 people came to live in Northern Ireland and 20,800 people left).
3. A slight reduction of 100 people due to other changes.
In the year between mid-2018 and mid-2019 growth due to positive natural change and net migration totalled 12,100 people. As has been the case in recent years, natural change (i.e. births minus deaths) was the main contributor to the increase in population, accounting for 60.2 per cent (7,300 people) of this growth. Net migration (i.e. inflows\(^4\) minus outflows\(^5\)) accounted for 39.8 per cent of the growth, with the number of people coming to live in Northern Ireland exceeding those leaving by 4,800 (see Figure 4). Mid-2019 is the second consecutive year that net migration has exceeded +4,000 people, representing the largest levels of net migration since mid-2008.

---

\(^4\) Inflows: the number of people coming to Northern Ireland to live.

\(^5\) Outflows: the number of people leaving Northern Ireland to live elsewhere.
4 Migration of people into and out of Northern Ireland

4.1 Northern Ireland continues to have a positive net migration

In the year ending mid-2019, the number of people coming to Northern Ireland to live was 25,600 and the number of people leaving to live outside of Northern Ireland was 20,800, resulting in a net increase in the population due to migration of 4,800 people. This was the highest total inflows to Northern Ireland since mid-2008.

Between the year ending mid-2018 and the year ending mid-2019, the number of people leaving Northern Ireland increased by 1,400 (7.2 per cent), and the number of people coming to live in Northern Ireland also increased by 2,100 (8.9 per cent). Since the number of people immigrating into Northern Ireland increased at a higher rate than the number of people leaving Northern Ireland, the net change in population due to migration grew from +4,100 people to +4,800 people between the year ending mid-2018 and the year ending mid-2019 (see Figure 5).

Figure 5: Estimated Total Inflows, Total Outflows and Net Migration (year ending mid-2001 to year ending mid-2019)

Download Chart (XLSX format – 96 Kb)
4.2 Where do migrants come from and go to?

Migration into and out of Northern Ireland can be analysed in two groups, namely:

- UK migration – Flows of people between Northern Ireland and the rest of the UK
- International migration – Flows of people between Northern Ireland and outside the UK

Figure 6 below shows the number of people migrating into and out of Northern Ireland by type (i.e. whether to/from the UK or International) for the year ending mid-2019.

Figure 6: Migration to and from Northern Ireland by Type in the year ending mid-2019

<table>
<thead>
<tr>
<th>Total Inflows</th>
<th>Total Net</th>
<th>Total Outflows</th>
</tr>
</thead>
<tbody>
<tr>
<td>25,600</td>
<td>4,800</td>
<td>20,800</td>
</tr>
</tbody>
</table>

11,400
UK Inflows

14,200
International Inflows

10,300
UK Outflows

10,500
International Outflows

Between the year ending mid-2018 and the year ending mid-2019, there was negligible change (100) in the number of people leaving Northern Ireland to live in the rest of the UK, while the number of people coming to live in Northern Ireland from the rest of the UK increased by 1,000 people (9.5 per cent). This led to inflows of 11,400 people and outflows of 10,300 people in the year ending mid-2019 and resulted in a net UK migration gain of 1,100 people.

During the same time, the number of people leaving Northern Ireland to live outside the UK increased by 1,300 (14.1 per cent) to 10,500, while the number of people coming to live in Northern Ireland from outside the UK increased by 1,100 (8.3 per cent) to 14,200. As a result, net international migration totalled 3,700 in mid-2019, slightly lower than 3,900 in mid-2018.

Download Map (PDF format – 89 KB)
Figure 7 shows a time series of net migration by type from year ending mid-2001 to year ending mid-2019. Mid-2019 is the sixth consecutive year that migration inflows have been greater than outflows.

Clearly international travel patterns have changed significantly in 19/20 because of Covid-19. This will effect migration levels in 19/20 and beyond. However, the extent of the impact is unknown.

Figure 7: Estimated net migration by type (year ending mid-2001 to year ending mid-2019)

Download Chart (XLSX format – 95 Kb)
5 The age structure of Northern Ireland’s population

5.1 The population of Northern Ireland is ageing

Age composition is one of the most important aspects of the population since changes in different age groups will have varied social and economic impacts. Figure 8 shows the population split by age and sex for mid-2009 and mid-2019 in the form of a population pyramid. This particular data representation allows for a more visual idea of how the numbers of people have ‘aged on’ in the decade to the year ending mid-2019 with the pyramid beginning to broaden around age 50 and over.

Over the three decades from year ending mid-1989 to year ending mid-2019 the median age (i.e. the age at which half the population is older and half is younger) of the Northern Ireland population has increased from 30.7 to 38.9 years. It is projected that from mid-2028 onwards the older population (people aged 65 and over) will be larger than the number of children (i.e. people aged 0 to 15 years).
5.2 How is the age structure of the population changing?

Over the 25 year period (1994 to 2019) Northern Ireland has seen changes in the proportion of the population in key age groups. The proportion of the population aged 65 and over has experienced the largest increase over the 25 year period, with a distinct accelerated growth in this population occurring from mid-2007. As a result, the proportion of the population aged 65 and over has increased by 28.1 per cent from mid-1994 to mid-2019. Conversely, the proportion of children (i.e. people aged 0 to 15 years) in Northern Ireland has decreased since mid-1994 by 17.8 per cent to mid-2019. The proportion of the population who are of working age (i.e. people aged 16 to 64 years) has remained relatively stable over the period.

Figure 9: Index of population change for key age groups in Northern Ireland, mid-1994 to mid-2019

Download Chart (XLSX format – 95 Kb)

Figure 10 shows how the rate of change between these three age groups translates into the makeup of the Northern Ireland population as a whole. The population has gradually become older with the proportion of children decreasing from 25.4 per cent of the population in mid-1994 to 20.9 per cent of the population in mid-2019. Conversely, the proportion of the older population (aged 65 years and over) has increased throughout this period from 13.0 per cent in mid-1994 to 16.6 per cent in mid-2019.
5.3 Change in age structure over the year

5.3.1 Children (0 to 15 years)

In mid-2019, just over **one in five** (20.9 per cent) people in Northern Ireland were children.

This growth of 2,400 children was a result of:

6 Ageing out refers to the cohort of people ageing from one group into the next. In this case, people who are aged 15 in mid-2018 will turn 16 by mid-2019 and therefore 'age out' of the Children (0 to 15 years) age group.
5.3.2 Working age population (16 to 64 years)

In the year ending mid-2019 the working age population\(^7\) increased by 0.3 per cent (from 1,179,900 to 1,183,000), representing 62.5 per cent of the population.

This growth of 3,100 people was a result of:

<table>
<thead>
<tr>
<th></th>
<th>2018 Population (1,179,900)</th>
<th>'Ageing in'(^8) +22,300</th>
<th>'Ageing out'(^9) -19,000</th>
<th>Net Migration +2,500</th>
<th>Deaths -2,700</th>
<th>2019 Population (1,183,000)</th>
</tr>
</thead>
</table>

Over the same period, the **younger working age population** (i.e. people aged 16 to 39 years) is estimated to have remained stable with a slight reduction from 579,500 people to 578,500 people, representing 30.6 per cent of the population. This population decline of 1,000 people in the younger working age group was a result of:

- more people ‘ageing out’ of this age group (24,100) than ‘ageing in’ (22,300);
- a net gain of 1,200 in this population age group due to migration; and
- a relatively small number of deaths (400)

The **older working age population** (i.e. people aged 40 to 64 years) grew by 0.7 per cent in the year ending mid-2019 (from 600,400 to 604,500), representing 31.9 per cent of the population. This growth of 4,100 was a result of:

- more people ‘ageing into’ this age group (24,100) than ‘ageing out’ (19,000);
- a net gain of 1,300 people due to migration; and
- a total of 2,300 deaths among people in this age group

---

\(^7\) The working age population is defined by the age at 30 June 2019 and is not based on the age for entitlement to state pension. Following the Pensions Act 2007 and 2011, the State Pension Age (SPA) for women will increase gradually to 65 by November 2018.

\(^8\) Ageing in refers to the cohort of people ageing from one group into the next. In this case, people who are aged 15 in mid-2018 will turn 16 by mid-2019 and therefore ‘age in’ to the ‘working age’ group (16 to 64 years).

\(^9\) Ageing out refers to the cohort of people ageing from one group into the next. In this case, people who are aged 64 in mid-2018 will turn 65 by mid-2019 and therefore ‘age out’ of the working age group and ‘age in’ to the ‘older population’ group (65 years and over) age group.
5.3.3 The older population (65 years and over)

In the year mid-2018 to mid-2019, the population aged 65 and over increased by 2.1 per cent (from 308,200 to 314,700), representing 16.6 per cent of the population.

This increase of 6,500 was due to:

2018 Population (308,200)  'Ageing in\(^{10}\)  +19,000  Deaths -12,500  2019 Population\(^{11}\) (314,700)

The population aged 85 and over increased by 2.7 per cent (from 37,700 to 38,700) between mid-2018 and mid-2019, representing 2.0 per cent of the population. The growth of 1,000 people in this age group was a result of:

2018 Population (37,700)  'Ageing in\(^{12}\)  +6,700  Deaths -5,700  2019 Population\(^{13}\) (38,700)

\(^{10}\) Ageing in refers to the cohort of people ageing from one group into the next. For example, people who are aged 64 in mid-2018 will turn 65 by mid-2019 and therefore 'age in' to the 'older population' group (65 years and over).

\(^{11}\) Between mid-2018 and mid-2019 there was also a small number of migrations. Net Migration for the 65 years and over population was <50.

\(^{12}\) Ageing in refers to the cohort of people ageing from one group into the next. For example, people who are aged 84 in mid-2018 will turn 85 by mid-2019 and therefore 'age in' to the 'population aged 85 and over' group.

\(^{13}\) Between mid-2018 and mid-2019 there was also a small number of migrations. Net Migration for the 85 years and over population was <50.
6 Population Estimates for areas within Northern Ireland

6.1 How has the population changed for Local Government Districts?

The estimated population for the 11 Local Government Districts (LGDs) in mid-2019 ranged from 117,400 people in Fermanagh & Omagh LGD to 343,500 in Belfast LGD. The mid-2019 population estimates by LGD are shown in Map 1 (overleaf).

Figure 11 presents the overall percentage population change for LGDs and the effect the components of change have had on the population. The population in all 11 LGDs increased in the year ending mid-2019. Lisburn & Castlereagh LGD had the largest percentage increase in population of 1.1 per cent, with migration being the main driver of growth (0.7 per cent) in this area. Mid and East Antrim LGD, had the smallest percentage change in population with an increase of just under 0.4 per cent which was caused by natural change of 0.1 per cent and positive net migration of 0.2 per cent.

Figure 11: Components of population change by Local Government District, mid-2018 to mid-2019 (ordered by population change)
Population change in Local Government Districts over the decade

Figure 12 presents the overall percentage population change for LGDs in the decade between mid-2009 and mid-2019 and shows that all LGDs increased in population over the ten year period. Over the decade, population growth ranged from 2.2 per cent in Derry City and Strabane LGD to 10.3 per cent in Lisburn and Castlereagh LGD.

Figure 12: Percentage population change by Local Government District (mid-2009 to mid-2019) (ordered by population change)

6.2 What is the age structure of the population in Local Government Districts?

Some general themes can be observed when looking at the age distribution of Local Government Districts. Figure 13 shows that in mid-2019, Mid Ulster LGD had the highest proportion of children (i.e. people aged 0 to 15 years) among its population (23.3 per cent) and this LGD also had the lowest proportion of population aged 65 and over (14.5 per cent). Conversely, Ards & North Down LGD had the lowest proportion of children (18.7 per cent) and the highest proportion of people aged 65 and over (21.4 per cent) in its population.
Belfast LGD had the highest proportion of the **working age population** (i.e. people aged 16 to 64 years) among its population (65.3 per cent), particularly at the **younger working ages** (people aged 16 to 39 years) (35.7 per cent). This may be attributable, in part, to Belfast being the primary centre for third-level education in Northern Ireland.

**Figure 13: Age structure of Local Government Districts (mid-2019) (ordered alphabetically)**

The differences in age distribution across the Local Government Districts can also be demonstrated using the median age. The median age in mid-2019 ranged from 35.9 years in Belfast LGD to 44.2 years in Ards and North Down LGD. In addition, the median in all eleven LGDs has steadily increased over the decade from mid-2009. For example, the median age in Derry City and Strabane (35.0 years to 38.0 years), Causeway Coast and Glens (38.0 years to 41.3 years) and Ards and North Down (41.0 years to 44.2 years) has increased by over 3.0 years from mid-2009 to mid-2019 respectively (download [median age table](#) for all LGDs).

**Median Age at Local Government District level**

The differences in age distribution across the Local Government Districts can also be demonstrated using the median age. The median age in mid-2019 ranged from 35.9 years in Belfast LGD to 44.2 years in Ards and North Down LGD. In addition, the median in all eleven LGDs has steadily increased over the decade from mid-2009. For example, the median age in Derry City and Strabane (35.0 years to 38.0 years), Causeway Coast and Glens (38.0 years to 41.3 years) and Ards and North Down (41.0 years to 44.2 years) has increased by over 3.0 years from mid-2009 to mid-2019 respectively (download [median age table](#) for all LGDs).
6.3 How has the population changed within Parliamentary Constituencies?

Parliamentary Constituencies (PCs) were designed to have roughly similar populations. The average population across PCs at mid-2019 was 105,200 people, ranging from 90,500 people in East Antrim PC to 128,900 in Upper Bann PC.

Lagan Valley PC and Upper Bann PC had the greatest percentage population increase (1.0 per cent). The main driver of population growth in Lagan Valley PC was migration (0.6 per cent), while the main driver for population growth in Upper Bann PC was natural change (0.6 per cent). The smallest percentage increase in population was in Belfast West PC (0.1 per cent) which was caused by natural change of 0.4 per cent and loss of people due to migration (-0.3 per cent). The net effect of natural change and outward migration in this area has led to a modest growth of 0.1 per cent.

Figure 14: Components of population change by Parliamentary Constituency, mid-2018 to mid-2019 (ordered by population change)

Parliamentary Constituencies and Northern Ireland Assembly Areas share identical geographies and names.
Population change in Parliamentary Constituencies over the decade

Over the ten year period mid-2009 to mid-2019 all Parliamentary Constituencies experienced population growth, ranging from an increase of 0.1 per cent in Belfast West to 11.4 per cent in Lagan Valley PC. The average population across the PCs increased from 99,600 in mid-2009 to 105,200 in mid-2019.

Figure 15: Percentage population change by Parliamentary Constituency (mid-2009 to mid-2019) (ordered by population change)

6.4 What is the age structure of the population in Parliamentary Constituencies?

In mid-2019, Newry and Armagh PC had the highest proportion of children (i.e. people aged 0 to 15 years) in its population (23.6 per cent). In contrast, Belfast South PC had the lowest proportion of children among its population (16.6 per cent). The PCs with the highest proportion of older people (i.e. people aged 65 years and over) among its population were North Down (22.0 per cent) and Strangford (20.3 per cent), while Belfast South PC had the lowest proportion of older people (13.9 per cent).

Download Chart (XLSX Format – 148 Kb)
At 69.5 per cent and 41.4 per cent Belfast South PC also had noticeably the largest proportion of its population being in the **working age** (i.e. people aged 16 to 64 years) and **younger working age** (i.e. 16 to 39 years) categories respectively.

**Figure 16: Age structure of Parliamentary Constituencies (mid-2019) (ordered alphabetically)**

**Median Age at Parliamentary Constituency Level**

The differences in age distribution across the PCs can also be demonstrated using the median age. In mid-2019, the median age across PCs ranged from 34.4 years in Belfast South PC to 44.4 years in North Down PC. In addition, the median in all eighteen PCs has steadily increased over the decade from mid-2009, ranging from an increase of 0.3 years in Belfast East PC (39.3 years to 39.6 years) to an increase of 3.8 years in East Antrim PC (39.3 years to 43.1 years) (download **median age table** for all PCs).
7 How does Northern Ireland compare to the rest of the UK?

Provisional mid-2019 population estimates for England and Wales\textsuperscript{15} were published by the \textbf{Office for National Statistics (ONS)} on 6 May 2020, together with the UK estimate as an aggregate of the UK constituent countries.\textsuperscript{16}

Northern Ireland’s share of the UK population has remained at 2.8 per cent since the year ending mid-2014. Map 2 below shows the mid-2019 population estimates for the UK. The population of Northern Ireland grew by 0.6 per cent in the year ending mid-2019. This was higher than the growth in Wales and Scotland (0.5 per cent each). England experienced growth similar to Northern Ireland at 0.6 per cent, while UK growth was 0.5 per cent for the year.

\end{table}

Source for UK estimates: Office for National Statistics, National Records of Scotland

\textsuperscript{15} Final mid-2019 population estimates for England, Wales and the UK will be published by ONS on 24 June 2020.

\textsuperscript{16} The mid-2019 population estimates for Scotland were published on 30 April 2020.
How does Northern Ireland compare to ROI?

The population of Northern Ireland grew by 0.6 per cent in the year ending mid-2019. However, the Republic of Ireland (ROI) had a higher rate of population growth (year to April 2019), its population grew by 1.3 per cent to 4.92 million. Table 1 compares the population estimates for Northern Ireland, ROI and the UK.

17 Population estimates for the Republic of Ireland (year ending April 2019) are published by the Central Statistics Office Ireland (CSO), and are available at: https://www.cso.ie/en/releasesandpublications/er/pme/populationandmigrationestimatesapril2019/

18 UK population estimates for the UK are published by the Office of National Statistics (ONS), and are available at: https://www.ons.gov.uk/peoplepopulationandcommunity/populationandmigration/populationestimates
9   Links to related statistics

Population estimates for the UK and its constituent countries are available from the Office for National Statistics website.

More detailed population estimates for Local Government Districts and Parliamentary Constituencies are available on the NISRA website. Population estimates can also be found for Health and Social Care Trusts, former 26 Local Government Districts, former Education and Library Boards, former Health and Social Services Boards, former NUTS Level III areas, Super Output Areas and former Electoral Wards.

Population Factsheets for Local Government Districts are now published as a separate summary document and can be found on the NISRA website.

Estimates of the population aged 85 and over are available on the NISRA website and released in September following the mid-year population estimates in June. Mid-2019 based population estimates will be released in September 2020.

Population projections for Northern Ireland and sub-national areas (2018-based) are available from the NISRA website. Future population projections will be released following the 2021 Census.

Population estimates for small areas in Northern Ireland are available on the NISRA website and are released in November following the mid-year population estimates in June. Mid-2019 based population estimates will be released in November 2020.

4. Population Pyramid
National Statistics status means that our statistics meet the highest standards of trustworthiness, quality and public value, and it is our responsibility to maintain compliance with these standards.

Population Estimates for Northern Ireland last underwent a full assessment by the Statistics Authority against the Code of Practice in July 2015. The assessment report can be found here. Following the Statistics Authority assessment the continued designation of these statistics as National Statistics was confirmed in August 2016.

National Statistics status was confirmed subject to NISRA implementing six specific requirements. An action plan outlining how and when NISRA addressed each of these requirements can be found here.

An action plan checklist with supporting documentation can also be found on the NISRA website.

Since the assessment by the UK Statistics Authority, we have continued to comply with the code of Practice for Statistics, and have made the following improvements:

- Improved clarity and insight by redesigning the statistical bulletin to include a key point’s summary for users. In addition, key point headlines have been included throughout the commentary so users are alerted to key messages.

- The associated data tables for mid-year population estimates are disseminated in a more innovative way by including a flat file and tabular format which users can interact with.

- We have improved the accessibility of mid-year population estimates by publishing data in 3* open data format on Open Data NI. We have also included a new ‘Links to related statistics’ section within the bulletin so users can explore the whole population statistics package, including older person estimates, population projections, small area population estimates and a range of other material.
11 Background Notes

11.1 Population coverage

Mid-year population estimates relate to the usually resident population on 30 June of the reference year and ages relate to a person’s age at this mid-year period. Long term international migrants are included in population estimates, however, short term migrants are not. The definition of a long term migrant which has been adopted from the United Nations is, ‘a person who moves to a country other than that of his or her usual residence for a period of at least a year (12 months), so that the country of destination effectively becomes his or her new country of usual residence’. Other changes include changes in armed forces personnel stationed in Northern Ireland.

11.2 Methodology

Population estimates are produced using two separate methods, the components of change and ratio change methods. At the Northern Ireland level population estimates are derived using the components of change method, which updates the latest Census estimates by ‘ageing on’ populations and adjusting for births, deaths and migration. Population estimates for areas within Northern Ireland are aggregated from Super Output Area level and are generally calculated from an average of the two statistical methods: the ratio change and cohort-component methods. Detailed information on the data sources which inform these two methods and how the estimates are produced is available in the Methodology Report.

11.3 Quality of administrative data

Population estimates are produced using a range of administrative data sources, the quality of which have been assessed in detail within the Population Estimates and Projections Data Quality Document. In addition, population estimates are compared to several administrative data sources including, active medical cards, electoral register, benefit claimants and National Insurance Number registrations to assure the quality of outputs. Any significant differences are examined further. NISRA also works closely with colleagues in ONS and National Records of Scotland (NRS) to assure the quality of population estimates across the UK. A paper comparing the methodological approaches adopted by producers of population statistics across the UK is available here.

11.4 Limitations

Migration is the most difficult component of population change to measure due to the absence of an administrative dataset designed specifically for measuring migration. NISRA uses the medical card register as the source in the production of migration estimates, however, there are known deficiencies with this approach. For example, it is recognised that the medical card register is deficient in recording the movements of young adult males; therefore the age
distribution for movements of young adult males is adjusted to be similar to the age distribution for the movements of young adult females.

Furthermore, not all outflows are measured fully by the medical card register and therefore outflows are scaled up by an additional 67 per cent. It is assumed only 3 out of 5 people will de register with their GP if they are leaving Northern Ireland (see Methodology Report for more detail).

England, Wales and Scotland use the International Passenger Survey (IPS) to measure international migration, however, Northern Ireland cannot rely on the IPS for measurement. The limitation with the IPS is that it does not cover the land border between Northern Ireland and the Republic of Ireland, and the uncertainty introduced when “Ireland” is given in response to survey questions – some people stating “Ireland” as their origin or destination may be referring to Northern Ireland.

While this means there is a methodological difference for the international migration estimates of Northern Ireland and the rest of the UK, NISRA and ONS are content that the methods used for Northern Ireland and the rest of the UK yield robust estimates for the UK as a whole. Furthermore, Northern Ireland migration statistics have been previously assessed by UKSA, who found them to be fit for purpose19.

Some data sources used in the production of population estimates for small geographical areas (e.g. School Census, Child Benefits, and Pensions data) rely on the use of postcodes to allocate people to specific small geographical areas. In a small number of cases, postcodes can span more than one small geographical area (3-5 per cent of postcodes). Therefore, properties within the same postcode can be in different small geographical areas. However, all properties with a given postcode are allocated to a single small geographical area based on where the “centre of the postcode” is located. This can give rise to some small inaccuracies in the resultant estimates for small geographical areas and is not unique to Northern Ireland statistics.
